ABOUT THIS WEBINAR:

Traumatic Brain Injury (TBI) may cause physical, cognitive, and behavioral changes that can be difficult to adapt to for both the individual and family members. These changes are usually temporary, but in some cases, recovery becomes a lifelong process of adjustments and accommodations for the injured person and the family. People with TBI can lead joyful and meaningful lives with the aid of families and friends who play a critical role in supporting the health and well-being of individuals with TBI. TBICoE recognizes the emotional, physical, and financial toll that is so often associated with caregiving.

This webinar examines the variety of educational information, resources, and strategies to help patients and their families learn about and cope with TBI. Presenters address the utilization of a strengths-based approach, age-appropriate techniques to familiarize children with TBI, communication strategies, and relationship dynamics.
